

Git & GitHub Assignment: ETL Pipeline Pull Request

Name: Ashish Sharma

Repository: order-etl-git-assignment

Repository URL: <https://github.com/AshishSharma0704/order-etl-git-assignment>

Pull Request URL: <https://github.com/AshishSharma0704/order-etl-git-assignment/pull/1>

Git Configuration

```
PS D:\order-etl-git-assignment> git config --list
diff.astextplain.textconv=astextplain
filter.lfs.clean=git-lfs clean -- %f
filter.lfs.smudge=git-lfs smudge -- %f
filter.lfs.process=git-lfs filter-process
filter.lfs.required=true
http.sslbackend=schannel
core.autocrlf=true
core.fscache=true
core.symlinks=false
pull.rebase=false
credential.helper=manager
credential.https://dev.azure.com.usehttppath=true
init.defaultbranch=master
filter.lfs.clean=git-lfs clean -- %f
filter.lfs.smudge=git-lfs smudge -- %f
filter.lfs.process=git-lfs filter-process
filter.lfs.required=true
user.email=ashishsharma070704@gmail.com
```

Commit History

```
PS D:\order-etl-git-assignment\order-etl-git-assignment> git log --oneline --all
59dd8ff (HEAD -> feature/add-cleaning-logic, origin/feature/add-cleaning-logic) Add order cleaning logic placeholder
6c3b57d (origin/main, origin/HEAD, main) Add basic ETL pipeline scripts
00b2a4c Create initial ETL project structure
PS D:\order-etl-git-assignment\order-etl-git-assignment> 
```

Clean Working Tree

```
PS D:\order-etl-git-assignment\order-etl-git-assignment> git status
On branch feature/add-cleaning-logic
Your branch is up to date with 'origin/feature/add-cleaning-logic'.

nothing to commit, working tree clean
PS D:\order-etl-git-assignment\order-etl-git-assignment> 
```

.gitignore

```
order-etl-git-assignment >  .gitignore

1  .env
2  data/
3  logs/
4
5  *.csv
6  *.parquet
7
8  __pycache__/
9  .ipynb_checkpoints/
```

Pull Request

Why .env and Data Files Were Ignored

The .env file contains sensitive credentials and configuration values. The data directory contains raw datasets that should not be version controlled. Logs are generated artifacts and do not belong in source control.

Interview Reflection Questions

1. Staging area vs local repository: The staging area prepares changes before commit; the local repository stores commit history.
2. Large datasets should not be committed because they increase repository size and slow Git operations.
3. A Pull Request enables review and discussion before merging changes.
4. `git pull` downloads remote changes; `git push` uploads local commits.
